Title No. C014

Logic Model

Logic models are graphic depictions that show clearly and concisely the causal mechanisms through which specific interventions can affect behavior and thereby achieve a health goal. They should be based in part upon theory and thus portray the “theories of change” that underlie an intervention.

While there are many types of logic models, some logic models specify (1) the health goal to be achieved, (2) the behaviors a person needs to change to achieve a health goal, (3) the risk or protective factors that affect those behaviors, and (4) the intervention components or activities designed to change each selected risk and protective factor.

In the figures below, first is a snapshot of a logic model for *Draw the Line/Respect the Line*. That model simply specifies all the activities, all the risk and protective factors and all the behaviors designed to affect the two health goals of *Draw the Line/Respect the Line*. Second is a more detailed model that specifies which particular activities affect which specific risk and protective factors, which in turn affect specific behaviors that affect teen pregnancy and sexually transmitted diseases.

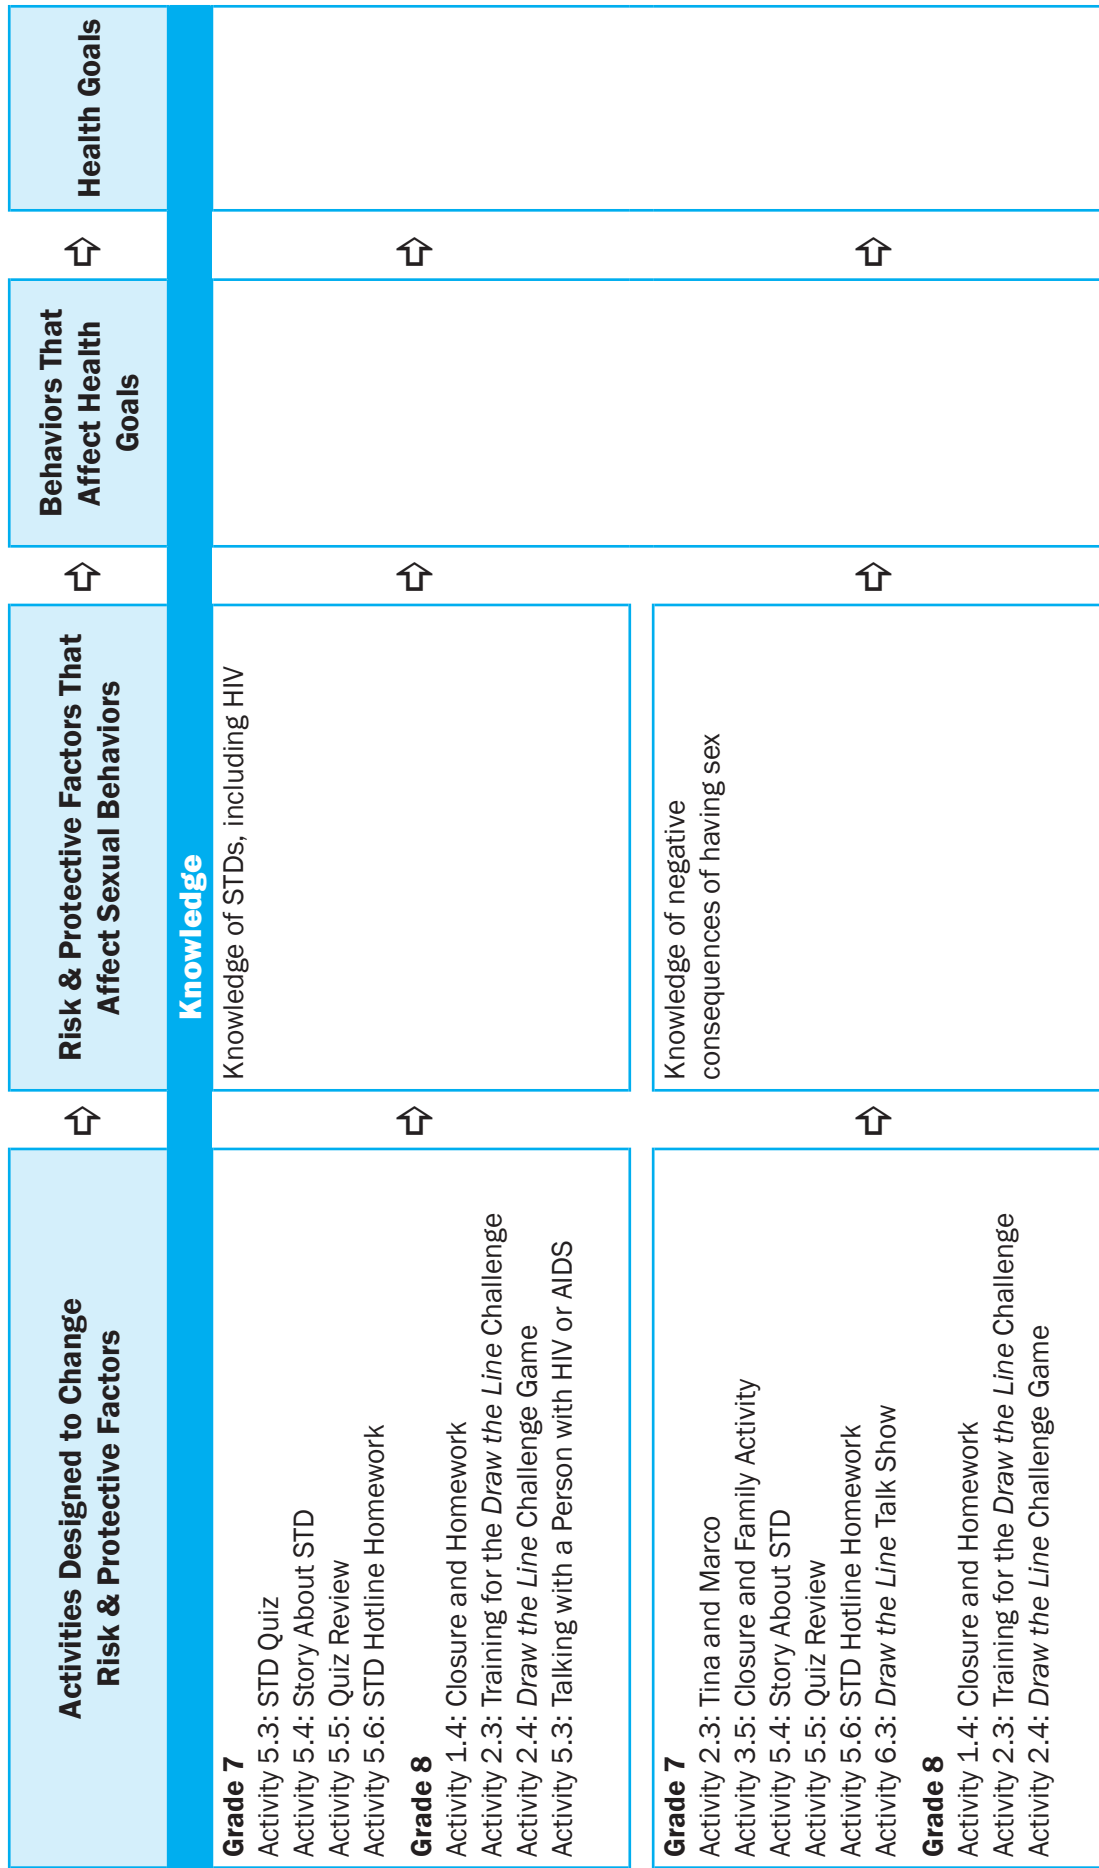

These models can:

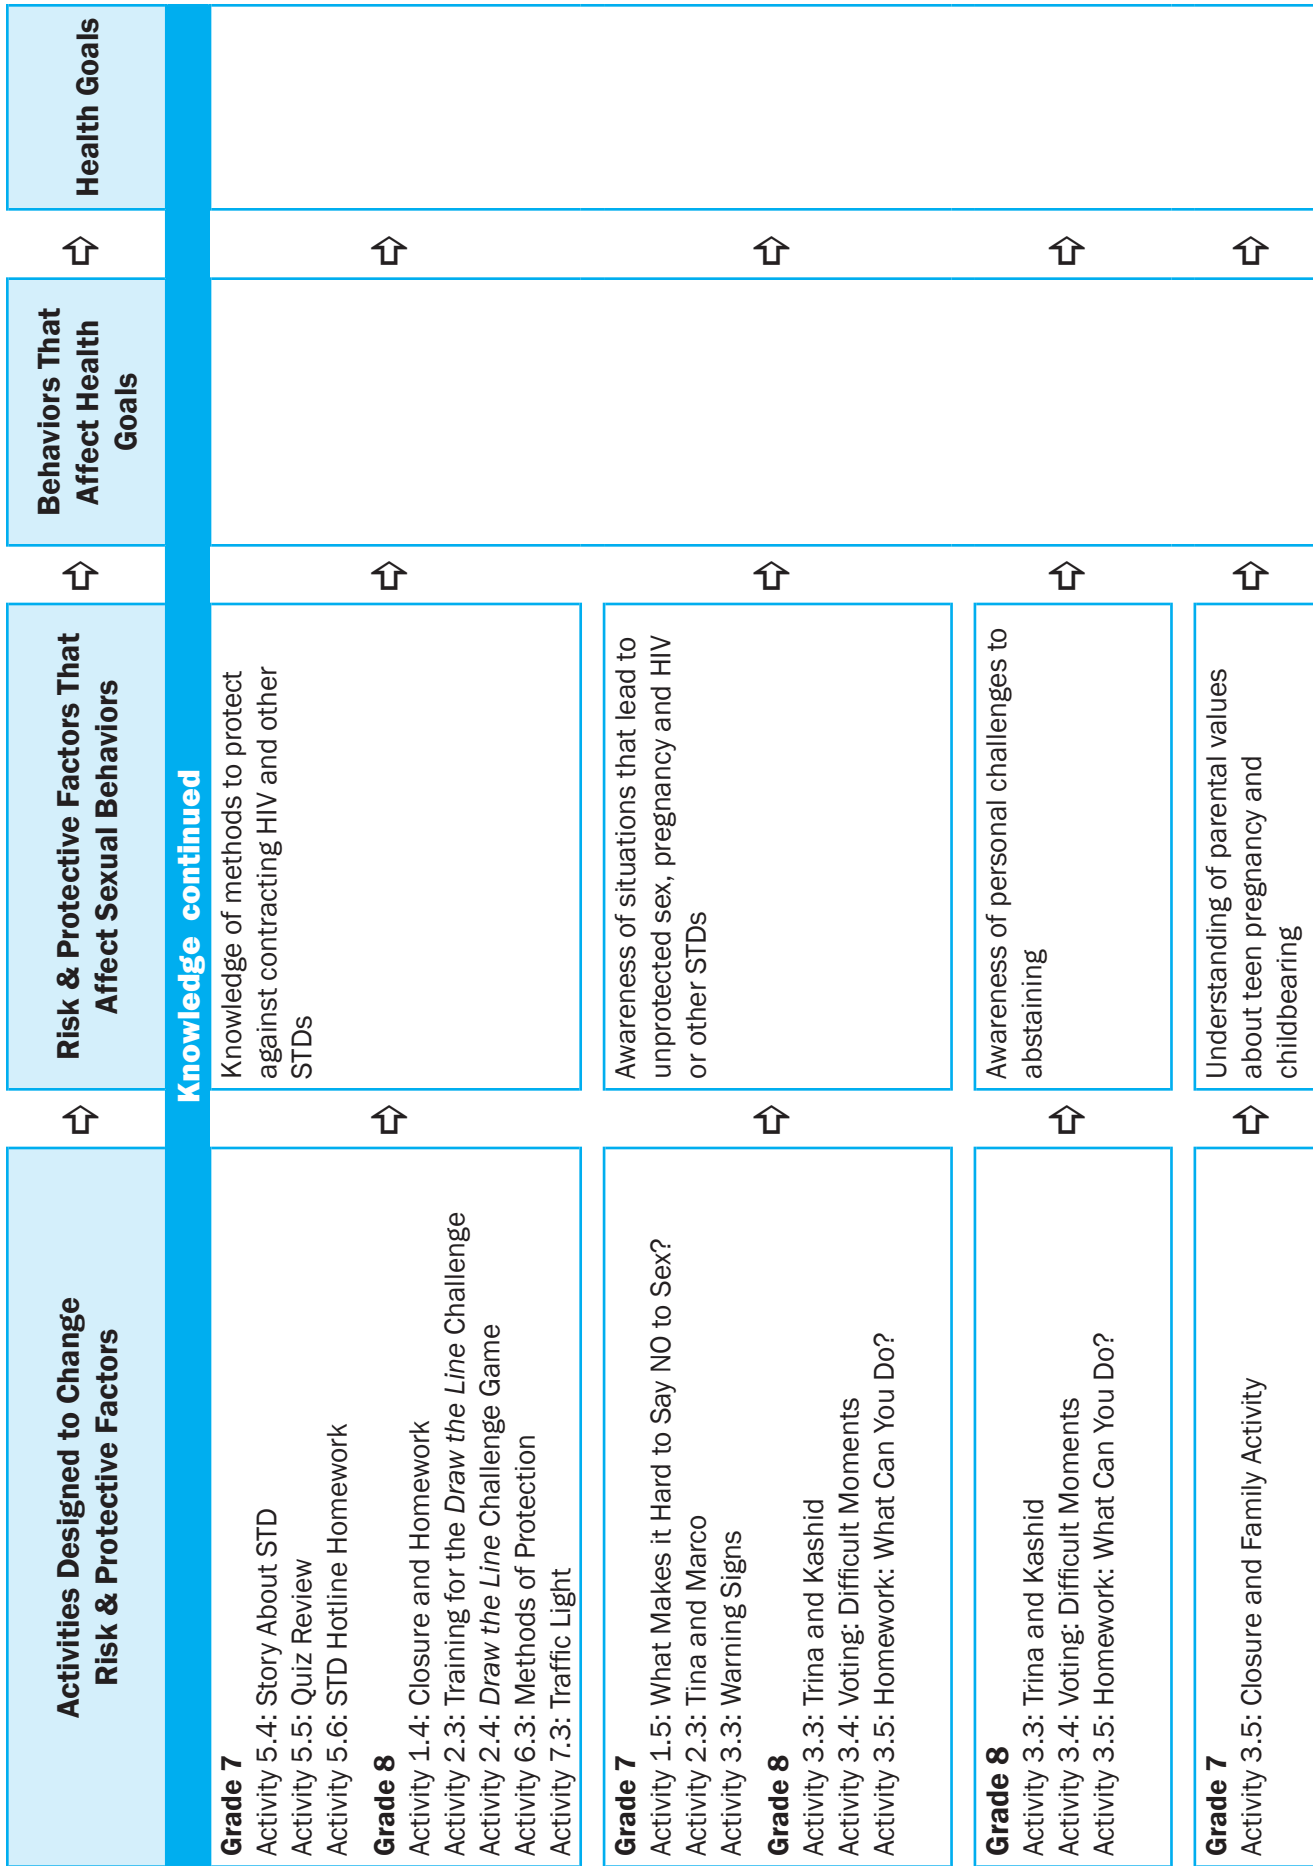

- ◆ Provide a clear rationale for each program activity by specifying the risk and protective factors each activity is designed to change. These rationales can help curriculum implementers understand the importance of each activity.
- ◆ Serve as a map to guide adaptations so that changes or additions are consistent with the logic and factors presented in the model.
- ◆ Specify the risk and protective factors and behaviors that should be measured in an impact evaluation.
